

# Sustainable Solutions

Electronic waste, or e-waste, refers to all items of electrical and electronic equipment (EEE) and its parts that have been discarded by its owner as waste without the intent of re-use. Small electronics—phones, laptops, printers, etc.—make up 38% of e-waste. Worldwide e-waste is expected to exceed 67 million tons by 2030—nearly doubling since 2015. For more than 40 years, Voiplink has been a leader in reducing the impact of e-waste on our environment. As one of the premier remanufacturers of telecommunications and networking equipment in the world, we annually prevent more than seventy-five tons of waste from finding its way into our landfills. And, what we can't utilize, we recycle in an environmentally-responsible manner.

## Why consider purchasing remanufactured equipment from Voiplink?

**E-waste** is a major pollutant impacting our water, air, and soil. Purchasing refurbished equipment is a proactive step you can take to reduce the impact of e-waste on the environment.

Utilizing remanufactured equipment increases the use of renewable resources, while reducing the consumption of raw materials, energy and emissions.

Our five-step remanufacturing process is one of the most rigorous in the industry. And, we back our remanufactured products with a twelve month advanced replacement warranty.

Save up to 60% what you pay for new equipment. Purchase full featured phones and systems for a fraction of the cost of new equipment.
